Setup

- product dataset (min 5)
  - properties: name, description, price (GBP)
- currency exchange rate table (monthly exchange rate)
  - exchange rate, currency code, validFromDate, ValidToDate (nullable)
- country table (3 countries)
  - name, country code, currency code

Code challenge

Create a data store to power a simple POC web app, built off REST API.

Display the products on a UI, allowing an end user to change currency by country.

Please write at least one test of any type, of your choice.

We use Angular or Blazor for UI development, however please choose which ever approach you wish.

The expectation is this should not take longer than 2-4 hours.

Please upload your solution to either github or share from an online document store.
